

# MITES FROM MAMMALS AT THE NEVADA TEST SITE<sup>1</sup>

Dorald M. Allred and Morris A Goates

During ecological studies at the nuclear test site north of Mercury, Nye County, Nevada (Allred, Beck and Jorgensen, 1963), mites were recovered from many vertebrates. Data on some collections were published by Allred (1962, 1962a, 1964), Allred and Beck (1962), Goates (1963), and Allred and Goates (1964). Additional collections represent eleven new mite-host associations, ten new distribution records for the test site and apparently for Nevada, and an unusual record of erythraeid mites of the genus *Caeculisoma* crawling on bats. These larvae are normally parasitic on arthropods. Although other arthropods were not found on the bats in our study, dipterous or other parasites may have left the hosts before we examined them.

We are grateful to James M. Brennan and Conrad E. Yunker, Rocky Mountain Laboratory, and Frank J. Radovsky, Hooper Foundation, for identification and verification of some of our mites. Some mites not reported here represent several undescribed species. These are being studied by these men who likely will describe them in subsequent publications.
